Practical : 3

AIM: Develop Student Admission Management Module using OOP Concepts (Class, Object, Constructor, Access Modifiers).

Source: program.cs

Code:

```
using System;

namespace StudentAdmissionManagement
{
   // Student Class
   class Student
   {
      // Private Data Members
      private int studentId;
      private string studentName;
      private int age;
      private string course;

      // Constructor
      public Student(int id, string name, int age, string course)
      {
         studentId = id;
         studentName = name;
         this.age = age;
         this.course = course;
      }

      // Display Student Details
      public void DisplayStudentDetails()
      {
         Console.WriteLine("------ Student Admission Details ------");
         Console.WriteLine("Student ID   : " + studentId);
         Console.WriteLine("Student Name : " + studentName);
         Console.WriteLine("Age          : " + age);
         Console.WriteLine("Course       : " + course);
      }

      // Update Course
      public void UpdateCourse(string newCourse)
      {
         course = newCourse;
```

```
        Console.WriteLine("\nCourse Updated Successfully!");
    }
  }

  // Main Class
  class Program
  {
    static void Main(string[] args)
    {
      // Creating Object using Constructor
      Student student1 = new Student(113, "Ashish", 19, "Computer Engineering");

      // Display Student Details
      student1.DisplayStudentDetails();

      // Update Course
      student1.UpdateCourse("Software Engineering");

      Console.WriteLine();

      // Display Updated Details
      student1.DisplayStudentDetails();

      Console.ReadLine();
    }
  }
}
```

output: Screenshot:
